EDUCATION

The University of Texas at Dallas - Bachelor's in Computer Science + Minor in Data Science & A.I

December 2027

TECHNICAL SKILLS

Front End | React.js, Next.js, Node.js, Vue, Angular, Swift, C#, Javascript, Typescript, HTML/CSS, Figma

Back End | Python, Java, C++, R, SQL, Express.js, MongoDB, Firebase/FastAPI/Postman, AWS, REST APIs, Redis

Developer Tools | Git, Docker, npm, BeautifulSoup, LangGraph/LangChain, Agile/Scrum, Wireshark, Microsoft Office Suite

Coursework | Artificial Intelligence, Machine Learning, Computer Networks, Adv Algorithm Design & Analysis, Database Systems

EXPERIENCE & PROJECTS

AI/ML Intern - Handshake AI

May 2026 - Present

- Created 50+ challenging software engineering benchmarks, golden solutions, and automated test cases using Python, JavaScript, C++, Docker, and Git to evaluate LLM performance across coding, debugging, and system design tasks.
- Identified critical model failure modes through adversarial test development, helping improve AI evaluation frameworks and benchmark reliability for next-generation coding assistants.

Instructor - iCode [North Dallas]

October 2025 - Present

- Teaching programming and technology concepts to 10+ students, covering Java, SQL, Python, Cybersecurity, and mentoring them through challenges to strengthen their technical skills and soft skills, problem-solving, collaboration, and critical thinking.
- Led interactive projects, coding exercises, and hands-on labs that increased student engagement by 35%, helping students build portfolio-ready projects, and gain practical experience with software development, data analysis, and cybersecurity tools.

Technology Officer & Project Mentor - Google Developer Student Club

Jan 2026 - Present

- Mentoring 50+ students through a 10-week full-stack project, supporting architecture design, backend development, and integration of 3+ APIs/services such as React.js, FastAPI, Gemini, Express.js, Figma, and REST APIs.
- Led weekly Scrum meetings and workshops (10+ meetings) to teach system design, deployment through git and Docker, Jira, and backend concepts, improving project completion readiness and presentation quality for final showcase.

Project | Uber Stall Guard

Personal Project

- Built a full-stack AI prototype that detects rideshare driver-stalling behavior from GPS telemetry, training a calibrated RandomForest classifier on 200 synthetic trip samples across 6 scenarios, achieving 87.5% accuracy on held-out test data.
- Designed a tiered decision system translating model confidence into automated rider protections using 5 engineered GPS features, and built an interactive map-based demo with React, Leaflet.js, and OpenStreetMap served via a FastAPI backend.

Project | Vigorithm - Bridging healthcare and fitness

Personal Project

- Architected a full-stack health-aware fitness platform - using Next.js, TypeScript, FastAPI, PostgreSQL, and the Claude API - that generates personalized workout and diet plans by cross-referencing user health conditions, injury history, and body goals.
- Built a RAG pipeline using LangChain and pgvector to parse uploaded medical documents and ground AI-generated routines in a user's actual health constraints, and designed a phased architecture separating the recommendation engine from a planned MediaPipe-based full-body form-correction module for future scalability.

Project | CoDriver - Association of Machinery and Computing (ACM UTD)

Group Project

- Built a 100% voice-activated AI mobile driving assistant using React Native, integrating 5+ RESTful APIs (Claude, ElevenLabs, Spotify, Google Maps, OpenWeather) for hands-free navigation, music control, and route recommendations.
- Developed full-stack architecture with Node.js, Express.js, and MongoDB, managing user authentication, preferences, and chat history, resulting in a 35% decrease in drowsy driving and car crashes.

Project | Aegis

Personal Project

- Developed a real-time scalable AI dashboard - using React, PyTorch, FastAPI, LangGraph, and Gemini API - that converts incident reports into risk signals and prioritized alerts, reducing response time by up to 35% for power grid operations.
- Integrated NASA, NOAA, and ODIN APIs to process >50,000 real-time data points daily for weather, natural disasters, and power outages, enhancing awareness and proactive response using a prediction model built with PyTorch and PySpark.
